Application Development Tools

SILVER AWARD: Applied Logic's FEU v.10*

“FEU’s performance stands out for many of the judges. FEU allows tasks that would otherwise require hours of work to be handled in minutes.”

If you’re looking for an alternative to the iSeries standard utility DFU, you might want to check out [Applied Logic’s File Edit Utility \(FEU\) v.10](#), our Silver Award winner for application-development tools.

FEU is a powerful database editor and data-manipulation tool for the iSeries, offering instant access to any file without programming or advance setup. It enables files to be viewed or updated in whatever manner desired without the limitations of DFU or the need to write special update or “fix-it” programs.

FEU’s performance stands out for many of the judges. FEU allows tasks that would otherwise require hours of work to be handled in minutes. In many different kinds of situations, FEU eliminates the need to write a special program to perform a

specialized function.

Equally impressive is FEU’s ease of integration into an environment. FEU is easy to install and can operate as a standalone utility or easily interface with IBM’s PDM product. Also, a variety of customized functions can be saved for later use and called from a menu or from another program.

**Editor’s Note: Applied Logic has since released FEU versions 11-17, which together offer numerous additional capabilities. See www.alcsoftware.com/feu for more information.*
